Customer Journey Map

Global Fuel Prices and Taxation Trends (2020–2026)

Student: Nazia Khan **Project type:** Individual

This journey map describes how the three scenario-based stakeholders may use the dashboard. It is a design model based on the assignment scenarios, not evidence from interviews or user testing.

Journey stage	Actions	Touchpoints	Thoughts / feelings	Opportunity
1. Define question	Identify a policy, logistics, or research question.	Project brief and dashboard landing view.	Need a clear starting point and relevant measures.	Use clear dashboard title, units, and chart descriptions.
2. Explore	Choose country/region filters and inspect relevant charts.	Dashboard filters and worksheets.	Want to compare like with like.	Test filter behavior and consistent scales/labels.
3. Compare	Review time trends, country differences, tax, crude, and income views.	Trend lines, bars, treemap, scatter plot.	Need to distinguish visible association from causation.	Provide cautious captions and context.
4. Interpret	Identify patterns that warrant follow-up.	Dashboard and story sequence.	Need confidence that data is represented accurately.	Check field names, missing values, and aggregation.
5. Use / share	Share the public dashboard and document limitations.	Tableau Public link and report.	Need a stable link and understandable summary.	Verify public access and include a README / demonstration.

Stakeholder-specific needs

• Scenario 1 — Dr. Sarah Mitchell, Energy Policy Consultant: Compare regional fuel-price trends and tax-policy differences, and explore how subsidies may relate to fuel prices. The analysis can inform discussion of equitable and sustainable policy, but the dataset and charts alone do not prove that taxes or subsidies cause a price change.

• Scenario 2 — Marcus Thompson, Global Supply Chain Manager: Compare fuel prices across countries and regions, examine historical trends and visible volatility, and consider implications for transport costs and procurement. Forecasting is not claimed as completed because no validated forecasting model has been confirmed.

• Scenario 3 — Professor Elena Rodriguez, Energy Economics Researcher: Explore associations between fuel prices, taxation, income levels, and affordability. Interpret scatter plots and comparisons as associations, not proof of causation; subsidy-specific conclusions require a confirmed subsidy field or other supporting evidence.

Individual project ownership

Owner: Nazia Khan. Responsibilities include reviewing the dataset, maintaining the Tableau workbook, checking dashboard/story behavior, documenting limitations, and preparing submission materials.
